## Outline

- Measuring Image Quality
- Colorimetric Approach
- Spatial Vision Approach
- Systems Approach
- Need for a Fundamental Approach for Digital Photography

## Color Image Quality

Reductions in image quality correspond to perceptible visual differences from some ideal and the magnitude of such differences.

## Thresholds

Threshold metrics describe the probability of detection of image artifacts.

JNDs — Just Noticeable Differences

## Scales

Interval scales of image quality describe the magnitudes of changes in image quality that are clearly perceptible.

Image A is  $N$ -units better than Image B.

A greater challenge ...

## Image Quality Circle

Engeldrum (2000)

Figure 2.3 - The complete Image Quality Circle showing all the Connecting Links.

## Systems vs. Fundamental Approaches

**Systems:** Relate Technology Variables Directly to Observer Ratings (JNDs or Scales).  
{Psychophysics & Statistics}

**Fundamental:** Relate Image Measurements to Observer Quality Scales (or JNDs) Regardless of Image Source  
{Psychophysics & Vision Modeling}

## Historical Approaches

- Colorimetric Measurements
- Spatial Vision Models
- Systems Metrics

## Colorimetric Approaches

For Simple (Constant) Viewing Conditions:

- CIE LAB  $E_{99}$  (or CIEDE2000)
- Patch-by-Patch (or Pixel-by-Pixel)
- Min., Mean, Max., Histogram
- Variance, Correlation, etc.

Color Appearance Models Sometimes Applied to  
More Complex Conditions:

- CIECAM97s (or CIECAM02)

## Spatial Vision Approaches

- Models of Spatial Vision ("Detection Models")
- Detectable Differences in Various Spatial Frequency Channels? (Overall?)
- Based on Human CSF / Threshold Data
- e.g., Daly's "Visible Differences Predictor",  
Lubin's "Sarnoff Model"

## Systems Approaches

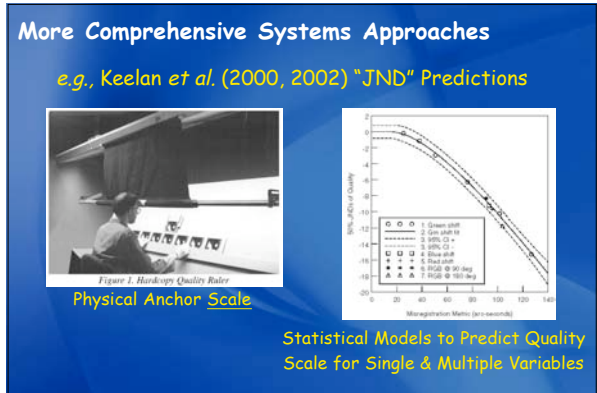

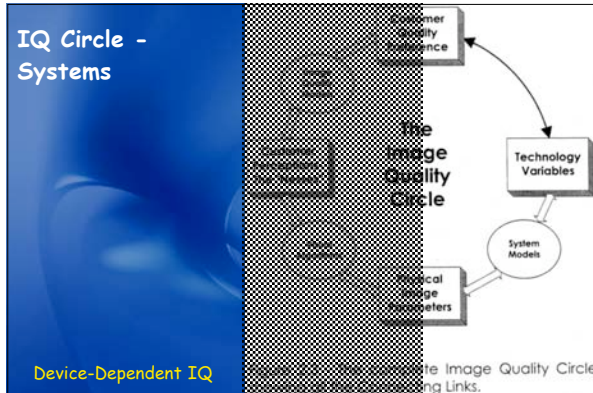

Simple Image Specifications

- Bits per Pixel
- Pixels per Image (or inch, or degree, etc.)
- Noise, Granularity
- Luminance, Contrast, Gamut Volume

## Two Image Quality Paradigms

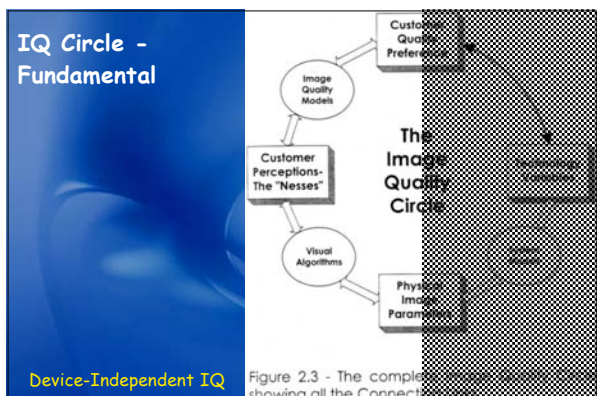

- **Device-Dependent Image Quality**
  - The Systems-Based Approach
- **Device-Independent Image Quality**
  - The Fundamental Approach
  - The Vision-Modeling Approach
  - Image-Appearance Modeling

### Device-Dependent Image Quality

Systems approaches to image quality measurement are analogous to device-dependent color specifications (e.g., RGB, CMYK).

Thus, they represent *device-dependent image quality*.

## The Need for a Fundamental Approach

- Color Approaches Tend to Ignore Spatial Attributes

$\Delta E^* \approx 50$  for each pixel  
 $\Delta Im = 0$  for appropriate viewing distance

- Spatial Approaches Tend to Ignore Color Appearance  
*(Luminance Only, No Adaptation, etc.)*

- Image Specifications Tend to Ignore Human Perception

## Image Quality as an Interval Scale

**Interval scales have no meaningful zero.**

*(What is zero image quality?)*

**Reduction in image quality can be a ratio scale.**

*(Zero reduction in IQ is a sub-threshold difference.)*

## A Unified Approach

An image quality metric can be derived as a measure of perceived difference from an ideal image.

## Device-Independent Image Quality

Fundamental approaches to image quality measurement are analogous to device-independent color specifications (e.g., XYZ, CIELAB  $L^*a^*b^*$ , CIECAM JCh).

Thus, they represent *device-independent image quality*.

**ASSERTION:** Device-independent image quality is necessary for open digital imaging systems.

## Psychophysics & Vision Modeling

### Device-Independent Image Quality Requires:

- Psychophysics to Quantify Perceptual Scales
- Vision Modeling to Relate Image Stimuli to Measured Perceptual Scales
- Iteration for Verification

## Human Vision Modeling

- Mathematical Models of Human Visual Performance in Response to Stimuli
- Often Empirical in Nature
- Concerned with Color Vision, Spatial Vision, Temporal Vision, Interactions

## Candidate Models

- S-CIELAB (Zhang & Wandell, 1995)
- S-CIELAB + CIEDE2000 (Johnson & Fairchild, 2002)
- CVDM (Jin, Feng, Newell, 1998)
- Modular Approach (Johnson & Fairchild, 2001)
- iCAM + Modular (Fairchild & Johnson, 2002)

## A Modular Framework

Johnson & Fairchild, *CIC 9* (2001)

### Modular Framework for IQ Scales

- Promising Framework for Image Differences
- Flexible Implementation

## $\Delta E$ vs $\Delta Im$

- $\Delta E$  (DE) has come to have a specific meaning in color difference measurement.
- True image difference metrics include higher-order processing and should have a different notation.
- $\Delta Im$  (DIm) proposed for image differences.
- A good  $\Delta Im$  (DIm) metric will reduce to a  $\Delta E$  (DE) metric for reference viewing conditions and configurations.

## Model Structure

Spatial Filtering, Local Attention, Local & Global Contrast, CIE Color Difference

## The Next Step

### Unification of Techniques for:

- Color Appearance Specification
- Color Difference Measurement
- Spatial Vision Modeling (Filtering & Adaptation)

RESULT: Image Appearance (& Difference) Model

## iCAM

### iCAM — image Color Appearance Model

A simple framework for color appearance, spatial vision effects, image difference (quality), image processing, and temporal effects (eventually)

An "Image Appearance Model"

# Spatial iCAM

Submitted to :

- CIC-10 (2002)
- CIE Congress (2003)

[illegible]

# Sneak Preview

Im

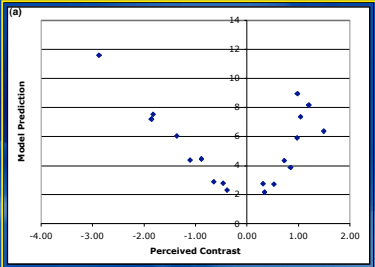

Figure (a) is a scatter plot showing the relationship between Perceived Contrast (X-axis) and Model Prediction (Y-axis). The X-axis ranges from -4.00 to 2.00, and the Y-axis ranges from 0 to 14. The data points are scattered, showing a non-linear relationship. The plot is labeled (a) in the top left corner.

Perceived Contrast	Model Prediction
-3.00	11.5
-1.80	7.5
-1.70	7.2
-1.40	6.5
-1.20	5.0
-1.10	4.5
-0.90	2.5
-0.80	2.0
-0.70	1.5
-0.60	1.0
0.00	2.0
0.10	1.5
0.20	2.5
0.30	2.0
0.40	1.5
0.50	4.0
0.60	4.5
0.70	6.0
0.80	7.5
0.90	8.0
1.00	8.5
1.10	6.5
1.20	6.0
1.30	8.0

## Image Difference Prediction (Contrast Data)

## Image Difference Prediction (Contrast Data)

## A Word on Preferences

- Preferences can be Treated Similarly
- Difference from Ideal
- "Naturalness"

	A	
	C	
	E	

- 

## Research Objectives

- Realization of Device-Independent Image Quality
- Collection of Psychophysical Image Quality and Image Preference Scales
- Formulation of Unified Model for Color Appearance, Image Reproduction, & Image Quality/Differences (an Image Appearance Model)

- 8

### Outlook (The Light Booth)

Image quality measurement will always require visual evaluation in addition to mathematical modeling just as a light booth is still required for basic colorimetry.

There are always other variables.

### Conclusion

- Device-Dependent Image Quality
  - Very Effective for Known or Closed Systems
- Device-Independent Image Quality
  - Necessary for Open Systems
  - Necessary for Revolutionary Systems
  - Necessary for Digital Photography?
- Image Appearance Models will Facilitate DIIQ

Thank You
